

An AI Agent Team that runs Debtor Email — and is ready for Sales.

Eleven specialised agents process every customer email end-to-end across Outlook and iController. They sort the noise, identify the customer, decide what's being asked, and draft the reply — leaving humans to do only the work that actually needs human judgment.

The same team is being prepared to run Sales Email next, and to learn-and-promote new patterns autonomously after that.

● Phase 64 just shipped: Stage 0 (input safety + per-run cost ceilings) is live. Platform is hardened and ready to scale.

SECTION 1 · TODAY

In production · debtor email shared mailboxes

The Debtor Email Pipeline

Every email lands in Outlook, gets passed across the team, and ends up either auto-handled or as a ready-to-send draft inside iController. We never auto-send — humans always have the final click.

TEAM A · TRIAGE Every inbound email goes through these four agents, in order.

Safety Agent
STAGE 0 · INPUT SAFETY

● LIVE

- Detects **prompt-injection** attempts before any other agent reads the email.
- Enforces a **hard cost ceiling** per email — no run can spiral.
- Suspicious mail goes to a **human-only review lane**.

Triage Agent
STAGE 1 · DETERMINISTIC SORT

● LIVE

- Auto-handles three noise categories end-to-end with **zero human touch and zero AI cost**: out-of-office, auto-replies, payment confirmations.
- Outlook: **applies category label + archives** the message.
- iController: **removes** the email from the operator queue.

Customer-ID Agent
STAGE 2 · RESOLVER

● LIVE

- 4-layer match: **thread → sender → invoice number → AI tiebreaker**.
- Looks up customers in **NXT**: brand-aware (Smeba, Sicli, Berk, Fire Control...).
- iController: **tags the email** under the matched account.

Intent-Routing Agent
STAGE 3 · COORDINATOR

● LIVE

- Reads the email and picks **one of 8 intents**: copy doc, dispute, address change, credit, contract, peppol, general...
- Multilingual: **NL · EN · DE · FR**.
- Hands off to the right specialist below.

TEAM B · HANDLERS Specialists. Each does one job in iController, in the customer's language.

Invoice-Copy Drafter
STAGE 4 · HANDLER

● LIVE

- Pulls the right invoice **PDF from NXT**.
- iController: **composes a draft reply** with the PDF attached, in the customer's language.
- Operator hits **Send**. We never auto-send.

Payment-Dispute Specialist
STAGE 4 · HANDLER

● PLANNED

- Drafts an **empathetic acknowledgment** in the customer's language.
- Tags dispute type: **already paid · wrong amount · service issue**.
- Routes to the **debtor team queue** with full context.

Address-Change Specialist
STAGE 4 · HANDLER

● PLANNED

- Extracts **street, postcode, city, country** from free-text mail.
- Proposes a structured **NXT customer-record update**.
- Human confirms before any data is written.

Credit-Note Specialist
STAGE 4 · HANDLER

● PLANNED

- Captures **invoice ref, amount, reason** for the credit request.
- Sends a **holding reply**, routes to debtor team for approval.
- Logs all credit requests for trend reporting.

Contract-Inquiry Specialist
STAGE 4 · HANDLER

● PLANNED

- Classifies **renewal · termination · pricing** question.
- Routes to the **contract owner** with a one-paragraph summary.
- Optional holding reply to the customer.

Peppol Specialist
STAGE 4 · HANDLER

● PLANNED

- Replies to **e-invoicing / Peppol enrollment** requests.
- Looks up the **entity-specific Peppol endpoint**.
- Sends the right NL/BE instructions automatically.

General-Inquiry Drafter
STAGE 4 · HANDLER

● PLANNED

- Catch-all polite **holding reply** in the right language.
- Promises a follow-up SLA (e.g. *"binnen X werkdagen"*).
- Escalates to the human queue with classification.

COPY-DOC VOLUME

~45 / month

13-mo telemetry · debtor + sales combined

WHAT THE TEAM DOES IN OUTLOOK

Inbox stays clean — automatically.

- Reads inbound email from the shared mailbox
- Applies a colour-coded category label per intent
- Archives noise (out-of-office, auto-replies, payment confirmations)
- Leaves only emails that need a human in the inbox

WHAT THE TEAM DOES IN ICONTROLLER

Drafts ready, queue cleared.

- Logs into iController via secure browser automation
- Tags each email under the matched customer account
- Removes auto-handled emails from the operator queue
- Saves a draft reply with the right PDF attached — never sends

SECTION 2 · NEXT

Phase 73 · onboards in under a day

The same team learns Sales Email.

The pipeline was designed cross-domain from day one. To onboard the Sales mailbox into the same workforce we add only two parts: a SugarCRM customer lookup and a Sales-specific Intent-Routing Agent. Every other agent — Safety, Triage, all the Handlers — is reused as-is.

2

Sales Email Swarm — built by registry insert, not by code

PHASE 73

Adding a swarm at Moyne Roberts is now a configuration row, not a project. Sales reuses the entire Triage and Handler team and only contributes its CRM-specific lookup and intent set.

existing Handlers

Reuse: 9 of 11 agents — Safety, Triage, all 7 Handler specialists. New: 1 SugarCRM resolver + 1 Sales coordinator. Estimated onboarding effort: **under one day**.

SECTION 3 · AFTER

Phases 71 → 72 · the platform learns from every override

Autonomous promotion — the workforce gets cheaper every week.

When the operator corrects an agent in Bulk Review, the platform writes that signal into a "Learning Inbox". Any pattern that an LLM keeps handling the same way gets promoted to a deterministic rule — faster, cheaper, more reliable. We graduate work down the cost curve automatically.

3a

Bulk Review · 4-axis override

PHASE 71

Each email gets one row showing **category · customer · intent · output**. Operators correct any one axis with a single click. Every correction is its own learning signal — we know exactly which agent missed.

Wrong category?

Wrong customer?

Wrong intent?

Wrong reply?

3b

Learning Inbox · graduated automation

PHASE 72

Patterns the AI keeps handling identically become free regex rules. Recurring senders become permanent customer mappings. Operator approves a candidate; the rule deploys with a full audit trail and can be rolled back in one click.
