

# The AI workforce now runs every Dutch debtor mailbox.

Big week of plumbing. We finished consolidating from custom-built scripts (one per brand, one per team) to a single AI workforce that processes every customer email through the same five-step process.

Every Dutch debtor mailbox is now live on it, plus the first Belgian one (Smeba Fire). The Sales mailbox **verkoop@smeba.nl** is connected and pulling email — the rest of the steps get switched on next week.

● 100% of Dutch debtor email now runs on the new platform.

SECTION 1 · HOW IT WORKS NOW

Same process, every brand, every team

## Every customer email goes through five steps.

Until last week, each brand and each team had its own custom script. Now there's one shared process — the same five steps run for Smeba, Berki, Fire Control, every other brand, and (next week) Sales. Adding the next mailbox is configuration, not a rebuild.

THE FIVE-STEP PROCESS · LIVE IN PRODUCTION

Each step does one job. If it can't decide, the email goes to a human queue with the reason flagged.

STEP 1

Security check

Spots manipulation attempts and limits cost per email before any AI reads the message.

This week: hardened so the inbox keeps moving even if the AI hangs.

STEP 2

Sort the noise

Auto-replies, out-of-office, payment confirmations are archived without a human ever seeing them.

This week: added a smart sorter (Cleo) for everything the simple rules can't slot.

STEP 3

Match the customer

Figures out which customer the email is from — across 6 brands and 4 languages.

This week: the match is now automatically tagged in iController. No more manual tagging.

STEP 4

Decide the action

Reads the email and routes it to the right specialist — invoice copy, payment dispute, address change, etc.

This week: a team lead (Debbie) now splits emails when one message needs more than one specialist.

STEP 5

Do the work

A specialist drafts the reply, attaches the right file, queues it in iController. Operator hits Send.

This week: the same specialists now work for any team. Sales reuses the Debtor specialists out-of-the-box.

SHIPPED

One unified process for every brand

Replaced the patchwork of brand-specific scripts. Every email — Smeba, Berki, Fire Control, Sicli, Smeba Fire — now follows the same five steps. **Adding a new brand is configuration, not a rebuild.**

SHIPPED

Onboarding a new mailbox = a config row

The platform's "what does each mailbox do" map moved from hard-coded into the codebase to a **configuration table**. Future mailboxes (UK, IE, new departments) onboard by adding a row, not by writing code.

SHIPPED

One audit trail for every AI decision

Every choice the AI makes — and every operator override — now lands in **one place**. Full transparency, ready for compliance review, and the foundation for measuring impact per intent.

SHIPPED

Sales mailbox can clean its own noise

When Sales goes live next week, the AI can already auto-archive auto-replies and out-of-office messages. **Sales reuses the Debtor pipeline** end-to-end, including SugarCRM where Debtor uses iController.

SHIPPED

Operator queue: nothing falls through

If the AI isn't confident, the email shows up in a human queue with the reason flagged: **"low confidence"**, **"no specialist exists yet"**, or **"specialist failed"**. Operators always know what to look at.

SHIPPED

Security layer is now bulletproof

The Step 1 security check now **fails gracefully**. If the AI hangs or hiccups, emails keep flowing. Operators are never blocked by a backend issue — the platform self-heals and sweeps stale rows.

Two new on the team this week

Plus one existing agent got a major upgrade.

**Cleo**  
THE SMART SORTER · STEP 2  
**NEW THIS WEEK**  
Reads the email and slots it into the right category whenever the simple rules can't decide. Works for Debtor and Sales out of the box — same agent, both teams.

**Debbie**  
THE TEAM LEAD · STEP 4  
**LIVE THIS WEEK**  
Splits an email across multiple specialists when one message needs more than one ("send invoice 12345 AND change my address"). Stitches their work into a single reply.

**Customer-ID Agent**  
CUSTOMER MATCHER · STEP 3  
**UPGRADED THIS WEEK**  
Now closes the loop end-to-end: when she matches the customer, she also **tags the email under that account in iController automatically**. No more manual tagging.

SECTION 2 · NUMBERS THAT MATTER

Production reality, May 2026

## What the platform processes today.

Real production data. The platform now sees every customer email across six debtor mailboxes — auto-resolves the noise, auto-tags the matches, drafts replies for the rest. Operators stay in the loop on every reply that leaves the building.

STATE OF PLAY

Six brands · four languages · one platform.

6

BRANDS IN PRODUCTION

Smeba · Smeba-Fire · Fire Control · Sicli-Noord · Sicli-Sud · Berki

4

LANGUAGES HANDLED

WHAT HUMANS NEVER SEE VS WHAT HUMANS REVIEW

✓ Out-of-office, auto-replies, payment confirmations — archived in Outlook + cleared from iController automatically. Three categories, end-to-end, no human touch.

✓ Customer matching — auto-tagged in iController without manual lookup.

✓ Invoice-copy reply drafts — composed in iController with the right PDF attached, in the customer's language.

★ Hits Send on every reply — operators always have the final click. **We never auto-send.**

★ Reviews ambiguous cases in the operator queue, with the AI's reasoning visible.

SECTION 3 · NEXT WEEK

Verify, then expand

## Three priorities for week 20.

The platform shape is locked. Next week is about confirming Step 3 actually matches customers correctly in production, getting the Sales mailbox live, and tightening the iController integration so it stays solid as we scale.

1

Verify customer matching in production

We just shipped a lot. Before adding more, we'll measure: does the AI match the right customer on a real sample of inbound mail? **Target: 90%+** matched correctly automatically; the rest surfaces in the operator queue with the reason flagged.

TARGET · 90% AUTO-MATCH

**Why now:** measure before we build more on top — we don't want to build specialists on a shaky foundation.

2

Sales mailbox goes fully live

**verkoop@smeba.nl** is fetching today but the rest of the steps aren't switched on yet. Next week we wire up Steps 1–4 for Sales, reusing every agent the Debtor pipeline already runs. **Same automation, no new code.**

TARGET · SALES AUTO-ARCHIVE LIVE

**Why now:** Sales actually has more invoice-copy volume than Debtor (43 of 85 in our 13-month sample) — the bigger volume sits here.

3

iController hardening & cleanup

iController is where humans review and send. Tightening the rare edge cases — queue stalls, retry flakes, session edge cases — keeps operators trusting the system as we scale to more mailboxes and more specialists.

TARGET · ZERO QUEUE STALLS

**Why now:** iController is our human-in-the-loop boundary. Trust here = trust in the whole platform.
